Measuring Food Waste Generated on Campus

The **university as a body measures the amount of food waste generated from food served within the university**, including food services managed by **outsourced providers**. A comprehensive **Campus Food Waste Tracking System** is in place to ensure continuous **measurement, monitoring, and documentation of food waste** across all operational levels — from **production, handling, and storage** to **distribution and consumption**.

Food waste data is collected daily by the catering partner and reported through the **Leanpath software platform**, which enables **real-time tracking and analytics**. The system records the **quantity, type, and cause of food waste**, generating monthly and annual summaries that are shared with the university administration for review and integrating the same into the institution's carbon footprint and sustainability reports.

In 2024, the university recorded a **total annual food waste of 16.00896 metric tonnes**, tracked systematically through Leanpath, covering all dining halls, food kiosks, and additional campus food outlets, reflecting the full scope of food services on campus.

Beyond measurement, the university ensures that collected food waste is diverted from landfill through organic composting and distribution to a local piggery farm, supporting circular waste management practices. The Organic Waste Composting (OWC) plant, with a capacity of 200 kg per day, converts food waste into manure used for campus horticulture activities.

The university also conducts awareness initiatives to promote food waste reduction, including optimized menu planning and student engagement campaigns. Through these coordinated efforts, the university ensures that food waste measurement, reduction, and responsible disposal are integral components of its sustainability strategy.
